

TOPIC: How sound quality is improved with architectural wood ceilings and walls

Wood ceiling and walls are a traditional material that has been used for centuries. Architectural wood products are also a growing trend in interior design. While maintaining their aesthetic appeal, our wood products can improve sound quality with a material that has historically been acoustically reflective. ASI Architectural will discuss where to start and how to balance design intent with acoustics. The presentation will cover acoustical requirements, how each product type achieves acoustical control, how much material is needed in a space and how NRC ratings affect the project. Join us to learn how sound works in a space and which product is right for your project.
